

Background

United Biscuits (UB) is a leading European manufacturer of biscuits and snacks and Endline have been installing the company's end of line packaging machines for over 20 years.

Scenario

Following an increase in output UB required another case sealing machine. While Endline's 704 random case sealing system, designed over 25 years ago, had been operating successfully for many years, UB required a second random sealer capable of higher speeds to deal with the level of output required.

Solution

While the 704 is testament to the longevity of Endline machines, the company is consistently re-engineering systems to meet evolving demand from customers. To meet UB's needs Endline installed its 734 Fully Automatic Case Taping machine which incorporated the latest technology to automatically close and seal a fully random size feed of cases at up to 20 cases per minute – twice the speed of the 704.

Results

Sealing 20 random cases per minute

Meeting customer needs following increase in demand

Doubled output
